Two major topics that are covered in this book are. the way and manner in which the processes of The capacity of a DRAM cell is quite limited. Hence it is desirable to increase the capacitance (C) of the cell capacitor to fully utilize its storage capacity. For this reason, semiconductor manufacturers have been attempting to increase the capacitance (C) of the DRAM cell capacitor by reducing the effective area of the storage electrode without sacrificing the stored charge. This is accomplished, in part, by reducing the thickness of the storage node dielectric layer (SiO<sub>2</sub>), which is typically between about 100 Å to about 300 Å thick. Unfortunately, as the thickness of the storage node dielectric layer (SiO<sub>2</sub>) is reduced, the leakage current through the storage node dielectric layer (SiO<sub>2</sub>) and overlying storage node conductor layer is increased. This increased leakage current leads to errors in data storage and increases power consumption. In order to prevent the leakage current through the storage node dielectric layer (SiO<sub>2</sub>) from being too large, a
