The present invention relates to a color solid-state image sensing device having a color filter. A conventional solid-state image sensing device has a color filter layer provided in front of a photoelectric conversion device, the color filter layer transmitting light of a certain wavelength range. A color solid-state image sensing device with such a color filter layer is a color filterless solid-state image sensing device, having no color filter layer.

A color filterless solid-state image sensing device is suitable for mass production, which is, therefore, generally used for cameras. A single-plate color camera using a color filterless solid-state image sensing device includes an optical filter which transmits only light in a prescribed wavelength range and prevents light in other wavelength ranges from entering the photoelectric conversion device. The optical filter is often called a black level filter, because the black level filter is adapted to prevent an unwanted decrease in the sensitivity of the photoelectric conversion

device. FIG. 1 shows the construction of a conventional color solid-state image sensing device. As shown in FIG. 1, the color solid-state image sensing device includes a photoelectric conversion device 3 for receiving light incident through a color filter layer 2 which transmits light of a prescribed wavelength range. The photoelectric conversion device 3 converts the incident light into an electric signal to generate an electric signal E. The color solid-state image sensing device further includes a black level correction circuit 4 for correcting the electric signal E to generate a corrected

electric signal E_c . The black level correction circuit 4 is adapted to output a black level signal B of a prescribed potential (hereinafter referred to as a black level potential) which is the black level potential of the 2d92ce491b
