Ganool 16 .Q: Is it bad
practice to move LINQ
methods from the model

to a helper class? I have a simple database structure like this: Table "users":

Username Password

UserType Table "books":

Title Author UserType

(foreign key references

users table) Table

"books_users": BookID

UserID I can do this in

LINQ to get a list of all

books in the database

where the username and

userType are both in the

table "users": var bookIds

= from user in

context.Users where

user.Username ==
@username &&
user.UserType ==
@userType select
user.UserID; If I wanted to
retrieve the books for that
list of users, do I need to
make a second query to
get the books in the
"books_users" table? Or
can I just do this? var
bookIds = from user in
context.Users where
user.Username ==
@username &&
user.UserType ==
@userType select

`user.UserID; var books = context.Books .Where(x => x.UserIds.Contains(bookIds)) .ToList();` That seems like it would be cleaner, but I don't want to do any unnecessary database access if there's a better way. Thanks. A: Yes, you should move this logic out of the model and into its own class. The point is that the data retrieval should be one level of abstraction higher than the domain model, so that you can change your

database schema without
changing the business
logic. What you are
