It performs a bit-wise comparison of its input word with the stored bit-wise comparison counter and provides a pulse every time a match occurs. The user can select between three different pulse widths of the output: 10, 100, or 1000 microseconds. The output may be connected to an 8-bit differential line or to a 16-bit positive or negative line. The internal digital logic control system is compatible with the Intel 8040 (see 8040 Data Sheet) and the Intel 8080 (see 8080 Data Sheet). The counter output can be connected to a digital display. Topics Related Products Preconceit Systems The Precog 7032 is an 8-bit digital logic analyzer that can display up to 64 digital logic signals simultaneously. It provides great flexibility in its programming and output display modes. Precog Systems Inc. of Chandler, Arizona supplies this logic analyzer and is the world's leading producer of logic analyzers. Simulink Logix Max from MathWorks is the ultimate development environment for creating mathematical and simulation models using Simulink. It provides a natural environment for building, simulating, and testing a wide range of dynamic models and systems. Simulink Logix Max simulates from Verilog and VHDL to C, C++, and C#. Relay Hose Tester from AutoTest Technology Inc. This equipment provides you with a reliable, digital drive test solution that does not rely on mechanical components, like screws and springs. The drive testers can be configured to test 2-, 4-, 8-, or 16-pole relays as 2d92ce491b
