To get the below mentioned text book with your PEN Name as it is official link.Q: Why do people keep creating sub-optimal architecture? It seems that people design (or design other people) sub-optimal designs and still are able to sell them to the marketplace. Even if the design is sub-optimal it is based on best practices, but there are examples in which people based their solution on their "experience" (past mistakes). The solution is done after many cost analysis to show what will benefit the business the most and without any estimator work (lacking experience or knowledge). The architecture is more or less complete, but it is not perfect. The process of how the architecture is designed is broken and too dependent on the owner. The architecture is far from optimal, but it is done by people with expertise and training. A: There are several reasons. No one knows what the optimal architecture is. People have figured out that everything worth doing is expensive, so the current best practices are generally the ones that will cost less. It's not profitable to build a good architecture. The amount of time and money to implement and maintain a great architecture is much greater than the value of a good architecture. The maximum-profit solution is a good-enough solution. It's not 100% of the way

---

there, but it works, it's the best-possible way to do what you need done, and it makes you money. Having a good architecture is a major barrier to entry. This is one of the primary reasons that the big boys (the big business/government software developers) have all adopted SOA. They see the way their SOA makes their existing functionality much easier to change and evolve. I think the real issue is that most people don't know what they don't know. They don't know what best practices, research, and industry standards are, let alone how to implement them. So they just do what's easiest or quickest or just plain work. A lot of times they don't even realize it's not the best solution, because they don't think that anybody could do anything better. And if someone does, they don't know how to get the same results. Very simple, when people don't know what they don't know they tend to overcomp
