Create a virtual null modem connection between two serial ports See also: Virtual Serial Port -- Latest changes: Version 1.5.9: - Added USB support. - Added support for more parallel ports. Virtual Null Modem is a handy application that can create a virtual connection point, known as emulated null modem. You can use the virtual null modem to connect to different applications to each other. Fast virtual connection point creator The program helps you create virtual null modems quick and easy, by specifying the ports used for the connection. You can set the interference for each connection, so that your data transmission will be faster or slower. This is a very useful for software developers, as they can simulate real-world data transmission, along with any other errors that might occur. Furthermore, you can select the type of null modem that will be created, such as a full handshake connection or a loop back handshake type. A virtual null modem has many advantages over a physical one, because it does not require a serial cable and the computer's physical serial ports still remain free for use. In addition, you can create unlimited virtual connections, which usually have higher transmission speeds than their physical counterparts. On top of that, any other application will not be able to detect differences between a real or virtual serial port. A powerful null modem emulator Virtual Null Modem allows you to create any number of virtual connection points without having to use cables for each serial port. You can now connect applications over your local network or Internet, without the restrictions created by cable length or data transmission speeds. What's New In?

Virtual Null Modem is a software application that allows you to connect two different applications that each has their own serial port to each other. License: Standard non-free - non-commercial Homepage: If you have an hour or two to spare, you can always learn some new Windows tricks. This how-to will teach you how to set your computer up as a LAN device. Also, you will find out how to assign a static IP address and configure the device to access a specific website. A computer which is setup to work like a LAN device will be able to connect to the Internet over a local network, thus removing the need for a physical Internet connection, which can be expensive and unreliable. In addition, you will be able to access shared data from all devices in the network, as well as access your data from any device on the Internet. If your device doesn't have a built in network adapter, you will need to install a USB network adapter. However, if you already have a network adapter installed in your computer, you can convert it to a LAN device. Also, before connecting a computer to a LAN, you will need to have an IP address, as well as a name. You will need to setup your computer to use a DHCP server. DHCP is a protocol which allows you to obtain an IP address from your Internet service provider. The IP address will not be the same as the one on your router, but it will be unique in your local network. You will need to set your computer to use a default gateway, which will direct all data that isn't sent to your computer to another device on your local network. In addition, you will need to configure your router to assign your computer a DHCP address. After you have set up your device, you will be able to access the Internet from any other computer that is connected to your network, whether it is a Windows device or a Mac device. You can use this shortcut to launch your favorite web browser, a graphic or other program, or anything else you wish. Shortcut In this section, you will find a guide on how to create a shortcut to the Windows desktop. A shortcut is a file, which is placed on your computer, that has a link to another location. By placing a shortcut on the desktop, you are essentially creating an icon that can be used to access the destination specified in the link. In the old days, you had to use the Windows command line to create a shortcut. Although this is still
