This was a real game-changer. The product, which Autodesk released at the time, was the first true PLM (Product Lifecycle Management) solution. It consisted of two components, the first being a PLM database and the second being a visual software component to manage the products that were in the PLM database. AutoCAD was used as the tool for creating products and the database component was used for tracking and managing them through a number of lifecycle phases, from the product concept to the finished product. The PLM software brought about three really big things. It changed the way the AutoCAD user interacted with the product.
