Nautilus is one of the most used filesystem managers on Linux based systems. It is most known for its simple, easy to use and sleek UI, but many people also appreciate its robust functionality and good performance. It is a very advanced file manager, which supports preview of files and a wide range of other basic operations. The stable 3.4.0 released a few days ago has brought new features as well as some bug fixes. The most important addition is the ability to delete files that are residing in the Trash. It was always possible to access those files and delete them, but they were still there. With the new release, you will no longer be able to see them. This release also improves the stability of the application and provides better error reporting. The bug that caused the crash on receiving file name too long has also been fixed. Other minor changes include the ability to display file caps, changing of the Nautilus browser and several other fixes. This release also fixes the bug that caused issues when using the Super key as a modifier while in the Trash view. Nautilus' overall performance has also been improved. It should be noted that the package maintainers are hoping to replace Nautilus with Nemo, their fork of the file manager. Since the Nautilus project still doesn't support the uses of the Super key as a modifier, that change is not happening in the near future.
