Rucklist FIFA 19 Guide For Beginners Luminol for Home Security Project: Afghan murder victim buried Subject to change at any time without notice.

Body of a resident from neighbouring community recovered from a clandestine mass grave buried outside Kabul.Q: How to suppress warnings for non-existent functions in C I have a large header file that includes several other files. Due to "maintenance nightmares", the functions in the header are changed frequently and an initial build of the project has many extra/unused functions. I am trying to suppress these warnings (or errors) without having to change every instance of them manually, and I think I know how I would do this in C++, but not in C. As a very basic example of my problem, I

---

have a function that looks like: `void foo(void) { // code here }` and it compiles fine with the warning: `warning: #pragma once in files that end in a.c I cannot figure out how to make gcc not generate this warning.` In C++, I can just include a very short file with a single line of something along the lines of: `#if 0 void foo(void); #endif` but what can I do in C (or a C file of my own)? I have looked here and here but they do not cover this issue (the closest solution seems to be here). A: Easiest is probably to add a dummy definition that will cause the compiler to stop complaining, e.g.: `void dummyfunc() { } void foo(void) { // code here }`

A:
