Igiko is a management tool that provides several options for all those, who need to access different physical or virtual hosts' devices, as well as perform different tasks on them. For each type of connection that you are trying to establish, there are different access points and needed configurations. Admins need to prove their status using unique access credentials, and for remotely accessing different devices, they must provide the host's access tokens received when that host was added and logged into the network. The RDP Gateway option is super useful and offers clean access to all hosts' machines for optimal management. Enter a VM's host IP and hostname, a URL of a webpage on the host. Enter a username and password of a user on the host If you want to access the host's desktop, you must provide the host's user's credentials If you want to access the host's command line shell, you must provide the host's user's credentials If you want to establish a connection using the RDP Protocol, you must provide the host's user's credentials Additional options are available for more details on the operation User-friendly management options Igiko provides several options that allow you to check the host's operational state, perform different tasks on the host, and access the host's devices. What's New In Igiko?

Access josts' desktops with the RDP Gateway As an administrator, you have multiple privileges available; you can connect to both hosts' devices and establish connections with all existing virtual machines for monitoring and remote control purposes. Using the RDP (Remote Desktop Protocol) Gateway function, you can easily connect to the objects you accessed in the current session (if you want access to objects in-between web sessions, pin them to have them always available). For each type of connection that you are trying to establish, there are different access points and needed configurations. Admins need to prove their status using unique access credentials, and for remotely accessing different devices, they must provide the host's access tokens received when that host was added and logged into the network. The RDP Gateway option is super useful and offers clean access to all hosts' machines for optimal management. Virtual machine access and administration

When having to conduct testing activities with traceable, accurate, and transparent results, rigorous management and quick access ways are needed. With Igiko, you can access the active Hyper-V virtual machines and monitor their activity. In order to establish the VM associations, as a normal user in the commonly-shared network, you have two connectivity options: using the RDP Mode or the VM Connect Mode (if connecting to the virtual machines' IP address is not possible). Igiko will allow you to live monitor the VMs activity and/or schedule future needed operations. You can set the VM update frequency, display important information about their functioning, and generate reports based on chosen contents (CPU, memory, disk space, network usage, plus information about the VM's OS, its uptime, total memory usage, and overall wellness). Essentials to understand the tool's usefulness Igiko is an excellent choice for all those who need to conduct and access virtual testing environments, administrators who need to monitor and evaluate performance, situations when it is imperative to access remote machines and servers, and hosting servers that need to provide remote access to hosted environments for their clients.
