MS Excel Recovery Professional is an easy-to-use utility that aims to restore your damaged Microsoft Excel files. Its premium version is a full-fledged data recovery tool that can handle all types of corrupt MS Excel files. The program displays a standard interface with an easy-to-use navigation panel. A drop-down list of different recovery options is available, making it easy to switch among different features. Both the "Recover all" and "Recover only" options are available. Upon loading, the program takes a while to examine the actual contents of a database. However, it does not take a long time to complete the whole recovery. The program outputs the total number of records, tables and formulas. The latter can be added to later on, as can be the comments, or the formats of spreadsheet cells. It is possible to add a timestamp to each output file using the specified format. A thorough settings section is available through the Options screen. The rest of the settings let you pick the recovery type on startup (quick, advanced, multi-file), a "recovered items" directory, and more. MS Excel Recovery Professional does not display error messages, so you do not have to bother about any missing or damaged files when performing the recovery job. The app does not hang, crash or display notification messages either. The program performs without any hiccups throughout our tests; the results it shows are good. The easiest way to recover data from corrupted MS Access databases! AccessFIX Data Recovery is a tool that enables you to quickly recover your lost or corrupted MS Access databases. After starting the software, you can pick the correct database file from the file explorer. The software offers a wizard-like interface and you can easily load the database. It allows you to get a quick overview of the database contents, table structure, records or fields. It allows you to examine tables in more detail and view the database contents in a tree structure. You can see a list of available tables, create new ones, delete old ones, change database properties or perform other functions with the help of standard buttons and dialog boxes. AccessFIX Data Recovery supports Microsoft Access 97, 2000, 2003, 2007 and 2010 databases. The software is equipped with a set of powerful tools that allow you to recover data from damaged databases. The utility uses two powerful algorithms for data recovery: heuristic and direct mode. Data recovery in direct mode is much quicker and you can save much of your time. If you don't want to spend time searching for lost information, then a data recovery in heuristic mode is what you need. If you only have a small amount of data on the computer, but your database has a large amount of documents, then you'll need to use this mode. To start a data recovery, you can choose a data recovery type. The program offers quick data recovery in the "Quick mode" (default), where you can recover one file at a time or perform full file data recovery in "Advanced mode". In the "Advanced mode" you can view a list of possible solutions and perform a quick data recovery. Furthermore, you can use the "Intelligent Mode" to retrieve data from inaccessible or lost documents. A list of all documents is shown in the "Tree View" and you can select the one you need and load it into the program. To speed up the process of retrieving information from the database, the software saves a copy of the original data during a data recovery. The "Save Mode" allows you to save the data or load it to the computer where it can be used by other programs. For your convenience, the program provides a "Copy Mode" that allows you to copy the recovered data to the hard drive. AccessFIX Data Recovery includes a number of useful tools for database recovery. You can use the "Database Properties" window to change the database name and properties. You can also change the default database search path and select a default folder for saving files.
