The following list is a breakdown of the most common Photoshop tools that every photographer should know.

**The Quick Selection tool** The Quick Selection tool (Q in Adobe's acronym system) is an incredibly powerful tool, capable of selecting the precise edge of an image. If you want to crop an image in Photoshop, then this is the tool that you want to use. To use the Quick Selection tool: 1. Choose Window⇒Quick Selection to open the Quick Selection tool. 2. Click inside your image and drag the cursor around until you see the edge of your image. 3. When you see the edge of your image, release the mouse button and select the Crop or Cut menu item at the top of the Layers window. Use the Quick Selection tool for specific tasks such as cutting out the background of a shot to create a compositional element. It is also possible to use this tool to create shapes within an image by creating a rectangle or any other shape.

**The Eraser tool** The Eraser tool (E in Adobe's acronym system) is incredibly useful and is often used as a replacement for the most useful tool in your photo shoot, the Clone Stamp. The Eraser tool creates the shape of the eraser on your tool palette (see Chapter 7) and enables you to delete unwanted areas of an image using a brush of just the right size. To use the Eraser tool: 1. Choose Window⇒Eraser to open the Eraser tool. 2. Select the Brush tool, set the Size to 1 px, and then click inside your image to create a brush shape. 3. When you see a small yellow triangle inside your image, click and drag around the edges to erase areas of your image. You may need to create a brush that is a few sizes smaller than the area you're erasing. Be careful not to erase too much or else you may lose too much of your image.

**The Magic Wand tool** The Magic Wand tool (W in Adobe's acronym system) is a very powerful tool for selecting parts of an image and is a much improved version of the classic magic wand selection tool. You can select your image's areas using a brush or by just selecting them. To use the Magic Wand tool: 1. Choose Window⇒Magic Wand to open the Magic Wand tool. 2. Select

Color Overlay is a popular feature that makes it easy to change the background color of selected objects. Layers are the building blocks of Photoshop and are used to arrange images or edit them in more detail. They enable you to add, merge, group, and delete layers. The Elliptical Marquee tools are used to select, draw or crop portions of an image. The Lasso tool is a polygon-based selection tool that selects an area by drawing a freehand shape. Layers have many uses in Photoshop. They can be used to create watermarks, borders, shadows and reflections, etc. You can merge, lock, arrange, invert, flatten and distort layers. You can assign them the same effects and filter settings as other layers. Photoshop's History panel contains the information about the changes you've made to your image. You can revert changes to the image in the History panel or the version history. The History panel is accessed by clicking History in the tools panel, and is displayed on the left side of the application's main window. Clicking on any thumbnail opens it in a full window. The History panel enables you to revert some or all of the changes you've made to an image, saving your work as you go along. To revert changes, click the history panel's "Revert to this layer" button, and choose what you want to go back to. Reverting changes in this panel is a common workflow for traditional photographers and artists. Photoshop's History panel contains the information about the changes you've made to your image. #### What's New In Photoshop CC?

Q: Web App to run on client's server and access EC2 from local machine I have an application written in ASP.NET that I would like to run on the client's local machine. It's more or less a desktop application (is that correct?). The client wants to access it from his phone, so he needs to run it as a web app. My question is: can I setup an EC2 instance with IIS running on it and can the client access the instance from his local machine? The reason I would like to do this is so that he can run it directly from his phone, without having to install a visual studio and build for his phone. I'm just worried that what I'm suggesting is a terrible idea. Thanks in advance! A: It's not a terrible idea at all. You just need to make sure that the client's phone has internet access to your server that they are trying to access. And if they want to be able to edit the application when it's running they will need something more than just a browser and a regular phone. You might want to look into AirPlay, which allows the client to interact with the application directly using their iPhone, iPod Touch, or iPad. Alternately, if they really want to be able to edit the application, they can install the free Google App Engine SDK for Python and run a web server on their machine that will allow them to edit files. They can just upload a new version of the application whenever they want to update it. You can also get access to this through WebAPI, which I believe is free. Q: How to show the

full path of an object in Java If I have an object, for example: `public class object { private Object name; public object(String name){ this.name = name; } }` And I use it like this: `object o = new object("Hello");` I can easily retrieve the name by doing: `System.out.println(o.name);` // prints "Hello" Is there a way I can get the full path of object object instead of just printing Hello? I mean, I'd like to print something like this: `public class object { private Object name; public object`
